*Note that the pictures used for the instructions were taken using an engine stand, not an actual frame.

1- Insert the swing arm pivot axle through the frame and the rear of the transmission case.

2- Use a jack to support the front of the transmission. Position the jack to allow clearance for the inner primary to slip on and allow access to the two mounting holes.

3- Adjust the height of the jack and get the transmission as level as possible. (If a jack is not available then blocks of wood and shims may be used to achieve this.)

4- At this point the motor may be installed into the frame.

5- Once the engine is in the frame and resting on the front engine mount and the rear engine mount is resting on the transmission case, you can line up the mounting holes and insert the front mounting bolts. Leave them loose at this point. See Picture 3.
6- Install the supplied transmission plate with the two raised bosses facing down and placed into the counter bore of the rear mounting holes of the engine case.

[Image 4]

7- Install the four supplied bolts, washers and nuts.

**NOTES:**
- There are two washers for each bolt.
- Bolts must be inserted from the bottom side due to interference with the rear cylinder.

[Image 5] [Image 6]

8- Using the jack to align the engine and transmission, carefully slip on the ½" engine spacer and inner primary. Do not use sealing o-rings for this alignment check.

[Image 7] [Image 8]

**CAUTION**
Do not force the primary on or allow the inner primary to support excessive weight. Any excessive force may damage the inner primary.
9- Check to make sure the surfaces of the engine, engine spacer, inner primary, and transmission mate evenly.

![Picture 9](image)

10- Check every bolt hole between the inner primary, engine, engine spacer, and transmission making sure they all align correctly (check areas circled below in Picture 10). If the holes do not line up correctly, adjust the height of the transmission until alignment is achieved.

![Picture 10](image)

11- Once all the bolt holes are aligned, tighten the front and rear engine mount bolts (bolts that are circled in Picture 11) to 54 ft-lbs but leave the transmission bolts loose. (Check the primary to make sure no excessive force is being applied while tightening the bolts.)

![Picture 11](image)
12- On the cam side (right side) of the bike use a feeler gauge to check the gap between the transmission plate and the top mounting surface of the transmission.

![Picture 12]

13- If a gap is present remove the transmission plate and insert the necessary shims on the right and left of the mounting pads of the transmission plate and the transmission.

![Picture 13]

14- Install and tighten all four bolts to 54 ft-lbs. Use Loctite® 272™ or equivalent. Check the alignment of the primary while tightening the bolts by sliding the inner primary on and off. There should be no binding or interference.

![Picture 14]
15- Remove the jack and slide the inner primary back on to ensure that all the bolt holes still line up.

16- If the holes do not line up then reposition the jack, loosen up the transmission bolts, and repeat steps 8 through 15.
17- Check the torque of these fasteners after the initial 50 miles and again at the first oil change.
